

# Open-Source Landscape: The Three Pillars

**Date:** June 5, 2026 **Purpose:** Map the competitive landscape across the three open-source repositories Vibrana is considering building out of its enterprise transformation work — so we know what exists, where it's saturated, where the white space is, and what to fork vs. build. Doubles as credibility-building input for the AI Transformation studio.

The three pillars (matching the [productized-tools thesis](#) — Company Graphs, AI Team Ops, Learning Journeys):

- 1. **Company Graph / Company Brain** — machine-readable org representation supplying *static* context into *dynamic* AI apps.
- 2. **Team Agentic Operating System** — one shared repo where multiple humans + agents collaborate with shared skills, harnessing, and tool integrations.
- 3. **AI-Native Enterprise Learning Platform** — personalized, department-specific curricula across an org.

## TL;DR — The Strategic Read

The three pillars are **not equally contested**, and that asymmetry is the whole story:

| Pillar            | Commercial side                                                                             | OSS side                                                                                                           | Our move                                                                                                  |
|-------------------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Company Graph     | Crowded & funded (Glean \$7.2B, Sana, Dust, Stardog)                                        | Primitives crowded (GraphRAG, Graphiti, Mem0, Cognee); <b>the curated org-ontology niche is empty</b>              | <b>Build the schema/governance layer; fork Graphiti for the engine</b>                                    |
| Team Agentic OS   | Coding side saturated (\$26B Devin, \$1.5B Factory); Anthropic Cowork is the looming threat | Coding orchestration saturated; <b>governed knowledge-work team-ops is empty</b> (only <600★ 2026 repos)           | <b>Build the governance-first, multi-client team-ops repo; fork orchestration plumbing</b>                |
| Learning Platform | Heavily saturated & funded (Multiverse \$2.1B, Degreed \$1.4B, Sana→Workday, Uplimit)       | Split into <i>legacy LMS</i> and <i>consumer AI tutors</i> — <b>the enterprise AI-native intersection is empty</b> | <b>Fork DeepTutor as base; differentiate on org-context + multi-dept + governance. Watch, don't race.</b> |

**The connecting insight:** all three commercial leaders (Glean, Sana, Dust) bundle the static context layer *inside* a closed runtime. Nobody ships the **org context as a portable, version-controlled, access-aware standard** that feeds *both* an agent OS *and* a learning platform. That seam — the Company Graph as the shared substrate — is our most defensible, most ownable position, and it's the one we already have a working prototype of (this back-office's `entities/` + numbered spine + `kb_search max_tier` ).

**One recurring moat across all three: governance.** Access tiers, leak prevention, NDA/legal chains, approval gates, PII audits, client-surface promotion, hub-and-spoke multi-client isolation. No OSS competitor in any of the three categories treats this as first-class. It is the hardest thing to copy and the thing a *consultancy* is uniquely credible shipping.

**Data caveat:** GitHub star counts below are approximate and were partly gathered via an environment index that appears to mirror/fork some repos (a few inflated or mislabeled entries were caught and corrected). Treat OSS star counts as directional. Commercial funding figures are web-verified and more reliable; figures marked unverified (notably Disco) conflict across sources — do not cite without checking.

## Pillar 1 — Company Graph / Company Brain

**Scope:** structured, machine-readable org context (people, teams, roles, projects, processes, systems, relationships) feeding static org knowledge into dynamic agents/apps.

The field splits into (A) graph/RAG/memory **primitives**, (B) enterprise knowledge/search & agent **platforms**, and (C) graph-DB / KG-construction **infra**.

### Landscape

| Name                               | Type                        | Stars / Funding            | Activity    | What it does                                                                                       | Fit / Overview                                                                  |
|------------------------------------|-----------------------------|----------------------------|-------------|----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <a href="#">microsoft/graphrag</a> | Company OSS (MIT)           | ~33k★                      | Active      | Extracts entities/relationships + community summaries from docs into a graph for RAG               | Auto-populated graph from not an org ontology. I populate, I schema             |
| <a href="#">HKUDS/LightRAG</a>     | Academic OSS (MIT)          | ~36k★                      | Very active | Lighter/faster GraphRAG alternative                                                                | Same primitive leaner baseline auto-populated                                   |
| <a href="#">getzep/graphiti</a>    | Company OSS (Apache-2.0)    | ~27k★                      | Very active | <b>Temporal</b> KG for agents: bi-temporal edges, custom entity/edge types, entity resolution      | <b>Closest for candidate the runtime engine.</b> Labeled curated or + access to |
| <a href="#">topoteretes/cognee</a> | Commercial OSS (Apache-2.0) | ~18k★ / <b>\$7.5M seed</b> | Very active | "Memory control plane": ECL pipeline from 38+ sources → graph+vector store; Agent SDK integrations | Strong mechanism overlap; good memory, no ontology. Not if they verify          |
| <a href="#">mem0ai/mem0</a>        | Commercial OSS (Apache-2.0) | ~58k★ / <b>\$24M</b>       | Very active | Universal memory layer, optional graph mode; AWS Agent SDK memory provider                         | Episodic/persistent memory, no static org Big minds                             |

|                                                |                             |                                                 |             |                                                                                             |                                                                                                 |

| <a href="#">letta-ai/letta</a> (ex-MemGPT)     | Commercial OSS (Apache-2.0) | ~23k★ / Felicis seed                            | Very active | Stateful agents w/ self-editing memory blocks                                               | Agent runtime memory; adjacent                                                                  |
| <a href="#">Canner/WrenAI</a>                  | Commercial OSS              | ~15k★                                           | Very active | "Open context layer": governed text-to-SQL semantic layer over 20+ sources                  | Interesting "governed context for agents" for DBs but DB-centric not people/prc                 |
| <a href="#">onyx-dot-app/onyx</a> (ex-Danswer) | Commercial OSS (YC)         | ~30k★                                           | Very active | Self-hostable enterprise search + chat over connectors                                      | Most credible OSS "Glean search not structured                                                  |
| <a href="#">run-llama/llama_index</a>          | Commercial OSS (MIT)        | ~50k★                                           | Very active | Data framework incl. PropertyGraphIndex / KG modules                                        | Toolkit to integrate with; no original model                                                    |
| <a href="#">neo4j-labs/llm-graph-builder</a>   | Company OSS (Apache-2.0)    | ~5k★                                            | Very active | Neo4j LLM pipeline to build KGs from unstructured data                                      | KG-construction infra                                                                           |
| <a href="#">FalkorDB/FalkorDB</a>              | Commercial OSS (SSPL)       | ~5k★ / VC                                       | Very active | Fast graph DB positioned as "the KG for LLM/GraphRAG"                                       | Storage platform only                                                                           |
| <a href="#">neuml/txtai</a>                    | Community OSS (Apache-2.0)  | ~13k★                                           | Very active | Embeddings DB + semantic graph + LLM workflows                                              | Primitive; no supply chain                                                                      |
| <b>Glean</b>                                   | Commercial (closed)         | <b>\$7.2B val, \$150M Series F; ~\$200M ARR</b> | Active      | Enterprise search + "Enterprise Knowledge Graph" of content/people/activity; agent platform | <b>The flagship commercial "company graph."</b> Open angle = the Glean (proprietary, black box) |

|                                              |                               |                                                                 |             |                                                               |                                                 |
|----------------------------------------------|-------------------------------|-----------------------------------------------------------------|-------------|---------------------------------------------------------------|-------------------------------------------------|
| <b>Sana</b>                                  | Commercial (closed)           | <b>\$130M total; \$500M val; → acquired by Workday Sep 2025</b> | Active      | Enterprise AI knowledge + learning platform                   | Bridges pi & 3; now a Workday-t incumbent       |
| <b>Dust</b> ( <a href="#">dust-tt/dust</a> ) | Source-available + commercial | <b>\$60M+; \$40M Series B (Sequoia); 3,000 orgs</b>             | Very active | "Multiplayer" enterprise agent OS over company data           | Closest to "agentic C product is moat, not repo |
| <b>Stardog</b>                               | Commercial (closed)           | ~\$30M raised                                                   | Active      | Enterprise KG + semantic layer; pivoting to "agentic AI + KG" | Incumbent enterprise vendor; he led             |

### White space & saturation

- **Saturated — do not build:** GraphRAG-family (graph-from-text), "memory layer for agents" (Mem0/Cognee/Letta/Zep — a VC-funded knife fight), Glean-alternative search (Onyx/DocsGPT/Quivr), graph DBs.
- **Empty — the gap:** A **standardized, human-authored, version-controlled org ontology** (people/teams/roles/projects/processes/decisions/access tiers as git-tracked YAML/MD/JSON-LD). Every search for "organizational knowledge graph / company brain / org graph for agents" returned **zero notable repos**. The field *auto-extracts* graphs; nobody ships a curated, declarative org spec as the static substrate for agents. There is no "schema.org for companies/agents." None treat **per-node access tiers as a retrieval-time filter** (our `kb_search max_tier` is genuinely novel).

### Fork shortlist

1. **getzep/graphiti** — fork for the runtime engine; add the org ontology + access-tier layer it lacks.
2. **topoteretes/cognee** — study ingestion (ECL) + Agent SDK integration; primary verticalization-risk competitor to watch.
3. **microsoft/graphrag / LightRAG** — embed as the auto-population layer over raw intake (emails, transcripts), reconciled into the curated ontology.
4. **onyx** — reference architecture for the OSS-Glean positioning; sit *upstream* of it, don't compete on search.
5. **Glean + Sana** — study only; define our wedge as the open, declarative, governed, portable *spec/standard* layer they'll never open-source.

---

## Pillar 2 — Team Agentic Operating System

**Scope:** one shared repo where multiple humans + agents collaborate, with shared skills, orchestration/harnessing, shared rules, and third-party integrations (Jira, Confluence, Slack/Mattermost, Toggl, Google Workspace, GitHub) — for AI transformation and product-building.

### Landscape

| Name                                                      | Type                          | Stars / Funding                                     | Activity      | What it does                                                    |

### White space & saturation

- **Saturated — avoid:** multi-agent frameworks (CrewAI/AutoGen/LangGraph/Swarm), solo-dev coding agents (Aider/Cline/Goose/OpenHands/Devin/Factory), parallel coding-agent runners (Composio/emdash/orca), app builders (Dify/Flowise/n8n).

- **Empty — the gap:** (1) genuine **multi-human + multi-agent in a shared repo** (only Wegent/Multica gesture at it, both tiny); (2) **non-coding / knowledge-work** team ops; (3) **governance as first-class** (access tiers, NDA/legal chains, approval gates, PII audit, client-surface promotion) — no OSS competitor has this; (4) **hub-and-spoke multi-client isolation** for a consultancy; (5) a **coherent real-business integration set** (Jira+Confluence+Mattermost+Toggl+Workspace+bookkeeping).
- **Looming threat:** Anthropic **Cowork** is moving toward exactly "department agents for knowledge-work teams." Hosted/closed/plugin-shaped → an **open, forkable, governance-heavy, git-native alternative is a defensible wedge, but the window is ~6–12 months.**

### Fork shortlist

1. **multica-ai/multica** — study the "agents as teammates" model (issue claiming, squads, compound skills); leave its governance + non-coding gap for us.
2. **wecode-ai/Wegent** — the only explicitly multi-human + multi-agent repo; study collaboration primitives.
3. **Composio agent-orchestrator + emdash** — fork the orchestration plumbing (git-worktree isolation, parallel spawn, CI/merge, Jira/Linear hooks) under our governance/human-collab layer.
4. **zubair-trabzada business packs + wshobson/agents** — study skill packaging/distribution; differentiate by bundling into a governed, multi-human, multi-client repo.
5. **Anthropic Cowork** — study as the incumbent to position against: forkable, you-own-the-data, governance-first, multi-client consulting ops vs. hosted closed per-seat plugins.

## Pillar 3 — AI-Native Enterprise Learning Platform

**Scope:** software generating personalized, department-specific, org-context-aware curricula with agentic tutoring. Not a MOOC; an AI-native corporate L&D engine.

### White space & saturation

- **Commercial side = crowded & richly funded:** Multiverse \$2.1B, Degreed \$1.4B, Sana→Workday, Docebo public, Cornerstone PE, Uplimit/Arist/Workera funded. Differentiation thinning (everyone claims "AI-first"). Competing commercially = fighting billion-dollar balance sheets and entrenched enterprise sales.
- **OSS side = genuinely thin (verified zero results for "OSS AI-native enterprise learning platform").** Two non-overlapping buckets: *legacy OSS LMS* (Moodle/Open edX/frappe — pre-AI) and *AI-native OSS tutors* (DeepTutor/Mr.-Ranedeer/etc. — consumer/academic, individual-learner).
- **The unoccupied intersection:** open-source, AI-native, **org-context-aware, multi-department personalized corporate L&D**. Nobody sits there. For a consultancy whose IP is org-context modeling (Pillar 1), this is the natural extension — the Company Graph feeds department-specific personalization no consumer tutor can do.

### Shortlist (fork / watch)

1. **HKUDS/DeepTutor** — fork/study; best OSS agent-native + RAG foundation. Gap to fill: org-context ingestion, multi-dept curricula, governance.
2. **Sana (Workday)** — benchmark; the incumbent ceiling and threat via Workday install base.
3. **Uplimit** — watch; best proxy for "what good looks like" and buyer expectations in AI-native upskilling.
4. **human-skill-tree** — study/compose; OSS skills-graph + MCP server, exactly the layer dept-specific curricula need.
5. **Skill-Anything** — study/compose; content-transformation building block to wrap in org-context + governance.

---

## Cross-Cutting Positioning — Where Vibrana Fits

### The thesis the data supports

The three pillars are **one system, not three products**. The Company Graph is the static substrate; the Team Agentic OS and the Learning Platform are dynamic consumers of it. Every commercial leader bundles the substrate inside a closed runtime — so the **portable, governed, open context layer is the wedge nobody can easily counter**, and it's the one we already prototype internally.

### Our three durable differentiators (true across all pillars)

- 1. **Governance-first.** Access tiers, NDA/legal chains, approval gates, PII audit, client-surface promotion, hub-and-spoke multi-client isolation. **No OSS competitor in any pillar has this.** A consultancy is uniquely credible shipping it.
- 2. **Curated + declarative, not auto-extracted.** Everyone else extracts graphs from documents or bundles black-box runtimes. We ship a human-authored, version-controlled, git-native source of truth.
- 3. **Consulting/knowledge-work native, not code-native.** The entire high-traction agent ecosystem is for coders. The business-function demand is proven (32k★ marketing skill packs) but unserved by anything collaborative or governed.

Build vs. fork — recommendation

| Pillar            | Build (our IP)                                                                       | Fork / compose                                                                | Don't build                                   |
|-------------------|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|-----------------------------------------------|
| Company Graph     | Org ontology schema + access-tier governance + static↔dynamic contract               | Graphiti (engine), GraphRAG/LightRAG (auto-populate)                          | Graph DBs, memory layers, Glean-style search  |
| Team Agentic OS   | Governance + multi-client hub-and-spoke + business integrations + human-collab layer | Composio/emdash (orchestration), Multica/Wegent (teammate model), skill packs | Agent frameworks, coding agents, app builders |
| Learning Platform | Org-context-aware multi-dept curriculum gen + governance                             | DeepTutor (base), human-skill-tree / Skill-Anything (primitives)              | Legacy LMS, consumer tutors                   |

Sequencing read

- **Lead with the Company Graph** as the open standard/spec — smallest surface, emptiest niche, hardest to counter, and the substrate the other two depend on. Strongest credibility play for the studio.
- **Team Agentic OS second** — biggest looming-threat urgency (Anthropic Cowork, ~6–12 month window). Open-source the governance-first knowledge-work team-ops repo to plant the flag before the category commoditizes.
- **Learning Platform third / watch** — most saturated and capital-intensive commercially; only attractive *because* we'd uniquely feed it from the Company Graph. Fork DeepTutor when the first two are landing; don't race the funded incumbents head-on.

Companion machine-readable graph: `2026-06-05-oss-three-pillars-graph.yaml` (repos → category → maturity → overlap → recommendation).
